

# // Cvscan: Constant Vulnerability Scanner

Almost daily, there's a new digital threat that targets your technology. Waiting for a yearly audit to fix vulnerabilities is a high-risk gamble. Patch vulnerabilities immediately so you can rest easy.

## What is CVScan?

CVScan is a custom-built tool that immediately identifies the latest software and hardware vulnerabilities on your network and gives you the necessary insight to address them.

- On-premise security vulnerability solution uncovers weaknesses in your network as they are identified by security researchers
- Scans any IP-based device that is connected to your network
- Fully managed service monitors your network and allows you to mitigate security issues on a frequent basis

## How is CVScan used?

Our solution uses a checks and balances approach to validate existing patching platforms. This ensures that actual coverage matches what is being reported to you. CVScan will:

- Scan your network at regular intervals
- Give you the information to help remediate vulnerabilities before they can be exploited
- Assist in making yearly audit findings minimal

CVScan takes away the stress of your yearly audit by routinely scanning your network and alerting you of current vulnerabilities that you can address now. It provides the timely information you need to address problems immediately, making your audit findings minimal.
